

Learning Objectives

In this chapter you will learn about:

- § Non-positional number system
- § Positional number system
- § Decimal number system
- § Binary number system
- § Octal number system
- § Hexadecimal number system

Learning Objectives

(Continued from previous slide..)

- § Convert a number's base
 - § Another base to decimal base
 - § Decimal base to another base
 - § Some base to another base
- § Shortcut methods for converting
 - § Binary to octal number
 - § Octal to binary number
 - § Binary to hexadecimal number
 - § Hexadecimal to binary number
- § Fractional numbers in binary number system

Number Systems

Two types of number systems are:

- § Non-positional number systems
- § Positional number systems

Non-positional Number Systems

§ Characteristics

- § Use symbols such as I for 1, II for 2, III for 3, IIII for 4, IIIII for 5, etc
- § Each symbol represents the same value regardless of its position in the number
- § The symbols are simply added to find out the value of a particular number

§ Difficulty

§ It is difficult to perform arithmetic with such a number system

Positional Number Systems

- § Characteristics
 - § Use only a few symbols called digits
 - These symbols represent different values depending on the position they occupy in the number

Positional Number Systems

(Continued from previous slide..)

- § The value of each digit is determined by:
 - 1. The digit itself
 - 2. The position of the digit in the number
 - 3. The base of the number system

(base = total number of digits in the number system)

§ The maximum value of a single digit is always equal to one less than the value of the base

Decimal Number System

Characteristics

- § A positional number system
- § Has 10 symbols or digits (0, 1, 2, 3, 4, 5, 6, 7, 8, 9). Hence, its base = 10
- § The maximum value of a single digit is 9 (one less than the value of the base)
- § Each position of a digit represents a specific power of the base (10)
- § We use this number system in our day-to-day life

Decimal Number System

(Continued from previous slide..)

Example

$$2586_{10} = (2 \times 10^3) + (5 \times 10^2) + (8 \times 10^1) + (6 \times 10^0)$$

$$= 2000 + 500 + 80 + 6$$

Binary Number System

Characteristics

- § A positional number system
- § Has only 2 symbols or digits (0 and 1). Hence its base = 2
- § The maximum value of a single digit is 1 (one less than the value of the base)
- § Each position of a digit represents a specific power of the base (2)
- § This number system is used in computers

Binary Number System

(Continued from previous slide..)

Example

$$10101_{2} = (1 \times 2^{4}) + (0 \times 2^{3}) + (1 \times 2^{2}) + (0 \times 2^{1}) \times (1 \times 2^{0})$$

$$= 16 + 0 + 4 + 0 + 1$$

$$= 21_{10}$$

Representing Numbers in Different Number Systems

In order to be specific about which number system we are referring to, it is a common practice to indicate the base as a subscript. Thus, we write:

$$10101_2 = 21_{10}$$

- § Bit stands for binary digit
- § A bit in computer terminology means either a 0 or a 1
- § A binary number consisting of n bits is called an n-bit number

Octal Number System

Characteristics

- § A positional number system
- § Has total 8 symbols or digits (0, 1, 2, 3, 4, 5, 6, 7). Hence, its base = 8
- § The maximum value of a single digit is 7 (one less than the value of the base
- § Each position of a digit represents a specific power of the base (8)

Octal Number System

(Continued from previous slide..)

§ Since there are only 8 digits, 3 bits $(2^3 = 8)$ are sufficient to represent any octal number in binary

Example

$$2057_8 = (2 \times 8^3) + (0 \times 8^2) + (5 \times 8^1) + (7 \times 8^0)$$

= $1024 + 0 + 40 + 7$
= 1071_{10}

Hexadecimal Number System

Characteristics

- § A positional number system
- § Has total 16 symbols or digits (0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F). Hence its base = 16
- § The symbols A, B, C, D, E and F represent the decimal values 10, 11, 12, 13, 14 and 15 respectively
- § The maximum value of a single digit is 15 (one less than the value of the base)

Hexadecimal Number System

(Continued from previous slide..)

- § Each position of a digit represents a specific power of the base (16)
- § Since there are only 16 digits, 4 bits (2⁴ = 16) are sufficient to represent any hexadecimal number in binary

Example

$$1AF_{16} = (1 \times 16^{2}) + (A \times 16^{1}) + (F \times 16^{0})$$

= $1 \times 256 + 10 \times 16 + 15 \times 1$
= $256 + 160 + 15$
= 431_{10}

Converting a Number of Another Base to a Decimal Number

Method

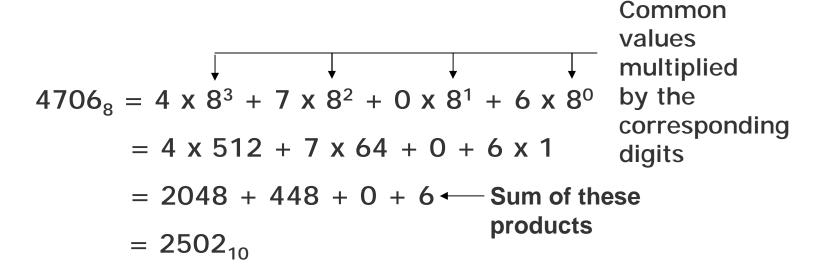

- Step 1: Determine the column (positional) value of each digit
- Step 2: Multiply the obtained column values by the digits in the corresponding columns
- Step 3: Calculate the sum of these products

Converting a Number of Another Base to a Decimal Number

(Continued from previous slide..)

Example

$$4706_8 = ?_{10}$$

Converting a Decimal Number to a Number of Another Base

Division-Remainder Method

- Step 1: Divide the decimal number to be converted by the value of the new base
- Step 2: Record the remainder from Step 1 as the rightmost digit (least significant digit) of the new base number
- Step 3: Divide the quotient of the previous divide by the new base

Converting a Decimal Number to a Number of Another Base

(Continued from previous slide..)

Step 4: Record the remainder from Step 3 as the next digit (to the left) of the new base number

Repeat Steps 3 and 4, recording remainders from right to left, until the quotient becomes zero in Step 3

Note that the last remainder thus obtained will be the most significant digit (MSD) of the new base number

Converting a Decimal Number to a Number of Another Base

(Continued from previous slide..)

Example

$$952_{10} = ?_8$$

Solution:

Hence, $952_{10} = 1670_8$

Converting a Number of Some Base to a Number of Another Base

Method

- Step 1: Convert the original number to a decimal number (base 10)
- Step 2: Convert the decimal number so obtained to the new base number

Converting a Number of Some Base to a Number of Another Base

(Continued from previous slide..)

Example

$$545_6 = ?_4$$

Solution:

Step 1: Convert from base 6 to base 10

$$545_6 = 5 \times 6^2 + 4 \times 6^1 + 5 \times 6^0$$

= $5 \times 36 + 4 \times 6 + 5 \times 1$
= $180 + 24 + 5$
= 209_{10}

Converting a Number of Some Base to a Number of Another Base

(Continued from previous slide..)

Step 2: Convert 209₁₀ to base 4

4	209	Remainders					
	52	1					
	13	0					
	3	1					
	0	3					

Hence, $209_{10} = 3101_4$

So,
$$545_6 = 209_{10} = 3101_4$$

Thus, $545_6 = 3101_4$

Shortcut Method for Converting a Binary Number to its Equivalent Octal Number

Method

- Step 1: Divide the digits into groups of three starting from the right
- Step 2: Convert each group of three binary digits to one octal digit using the method of binary to decimal conversion

Shortcut Method for Converting a Binary Number to its Equivalent Octal Number

(Continued from previous slide..)

Example

$$1101010_2 = ?_8$$

Step 1: Divide the binary digits into groups of 3 starting from right

<u>001</u> <u>101</u> <u>010</u>

Step 2: Convert each group into one octal digit

$$001_2 = 0 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 = 1$$

 $101_2 = 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 = 5$
 $010_2 = 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 = 2$

Hence, $1101010_2 = 152_8$

Shortcut Method for Converting an Octal Number to Its Equivalent Binary Number

Method

- Step 1: Convert each octal digit to a 3 digit binary number (the octal digits may be treated as decimal for this conversion)
- Step 2: Combine all the resulting binary groups (of 3 digits each) into a single binary number

Shortcut Method for Converting an Octal Number to I to Equivalent Binary Number

(Continued from previous slide..)

Example

$$562_8 = ?_2$$

Step 1: Convert each octal digit to 3 binary digits

$$5_8 = 101_2, \qquad 6_8 = 110_2, \qquad 2_8 = 010_2$$

$$6_8 = 110_2$$

$$2_8 = 010_2$$

Step 2: Combine the binary groups

$$562_8 = 101 110 010$$
 $5 6 2$

Hence, $562_8 = 101110010_2$

Shortcut Method for Converting a Binary Number to its Equivalent Hexadecimal Number

Method

- Step 1: Divide the binary digits into groups of four starting from the right
- Step 2: Combine each group of four binary digits to one hexadecimal digit

Shortcut Method for Converting a Binary Number to its Equivalent Hexadecimal Number

(Continued from previous slide..)

Example

$$111101_2 = ?_{16}$$

Step 1: Divide the binary digits into groups of four starting from the right

0011 1101

Step 2: Convert each group into a hexadecimal digit

$$0011_2 = 0 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 = 3_{10} = 3_{16}$$

 $1101_2 = 1 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 = 3_{10} = D_{16}$

Hence, $111101_2 = 3D_{16}$

Shortcut Method for Converting a Hexadecimal Number to its Equivalent Binary Number

Method

- Step 1: Convert the decimal equivalent of each hexadecimal digit to a 4 digit binary number
- Step 2: Combine all the resulting binary groups (of 4 digits each) in a single binary number

Shortcut Method for Converting a Hexadecimal Number to its Equivalent Binary Number

(Continued from previous slide..)

Example

$$2AB_{16} = ?_2$$

Step 1: Convert each hexadecimal digit to a 4 digit binary number

$$2_{16} = 2_{10} = 0010_2$$

$$A_{16} = 10_{10} = 1010_2$$

$$B_{16} = 11_{10} = 1011_2$$

Shortcut Method for Converting a Hexadecimal Number to its Equivalent Binary Number

(Continued from previous slide..)

Step 2: Combine the binary groups
$$2AB_{16} = \underline{0010} \quad \underline{1010} \quad \underline{1011}$$

Hence, $2AB_{16} = 001010101011_2$

Fractional Numbers

Fractional numbers are formed same way as decimal number system

In general, a number in a number system with base b would be written as:

$$a_n a_{n-1} \dots a_0 \cdot a_{-1} a_{-2} \dots a_{-m}$$

And would be interpreted to mean:

$$a_n \times b^n + a_{n-1} \times b^{n-1} + ... + a_0 \times b^0 + a_{-1} \times b^{-1} + a_{-2} \times b^{-2} + ... + a_{-m} \times b^{-m}$$

The symbols a_n , a_{n-1} , ..., a_{-m} in above representation should be one of the b symbols allowed in the number system

Formation of Fractional Numbers in Binary Number System (Example)

	Binary Point								
Position	4	3	2	1	0	1	-2	-3	-4
Position Value	24	2 ³	2 ²	2 ¹	20	2-1	2 -2	2-3	2-4
Quantity Represented	16	8	4	2	1	1/2	1/4	1/8	¹ / ₁₆

Formation of Fractional Numbers in Binary Number System (Example)

(Continued from previous slide..)

Example

$$110.101_{2} = 1 \times 2^{2} + 1 \times 2^{1} + 0 \times 2^{0} + 1 \times 2^{-1} + 0 \times 2^{-2} + 1 \times 2^{-3}$$

$$= 4 + 2 + 0 + 0.5 + 0 + 0.125$$

$$= 6.625_{10}$$

Formation of Fractional Numbers in Cotal Number System (Example)

	Octal Point							
Position	3	2	1	0	1	-2	-3	
Position Value	83	82	81	80	8-1	8-2	8-3	
Quantity Represented	512	64	8	1	1/8	1/ ₆₄	¹ / ₅₁₂	

Formation of Fractional Numbers in Cotal Number System (Example)

(Continued from previous slide..)

Example

$$127.54_{8} = 1 \times 8^{2} + 2 \times 8^{1} + 7 \times 8^{0} + 5 \times 8^{-1} + 4 \times 8^{-2}$$

$$= 64 + 16 + 7 + \frac{5}{8} + \frac{4}{64}$$

$$= 87 + 0.625 + 0.0625$$

$$= 87.6875_{10}$$
